DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
2. Claims 1 and 5-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peterson (US 6,653,417) in view of Takebe et al. (US 3,919,185), Shimazaki et al. (US 5,213,932), and Ota. (5,240,803).

Peterson teaches a catalyst composition comprising a transition metal complex represented by Formula I and a cocatalyst (col. 2, lines 28-41; col. 6, lines 44-50; and Examples 1-3). While Peterson generally teaches that an antistatic agent can be used in the polymerization process (col. 11, lines 1-3), Peterson does not specify the type of the antistatic agent.

Takebe teaches use a metal salt of an alkyl salicylic acid as the antifouling agent in the olefin polymerization in the presence of a Ziegler catalyst (col. 3, lines 33-61). When the metal is selected from zinc, and the carboxylate is selected from alkylsalicylate, Takebe's polymerization process meets all of the limitation of the instant claims. Zinc alkylsalicylate is commercially available antistatic agent under trademark Bontron E-84 as disclosed in Shimazaki (col.4, lines 30-31) and Ota (col. 11, lines 47-48).

Thus, it would have been obvious to a skilled artisan at the time the invention was made to employ the commercially available antistatic agent, zinc alkylsalicylate, to Peterson's catalyst composition in order to provide olefin polymers with reduced fouling

Art Unit: 1713

since zinc alkylsalicylate is readily available and in the absence of any showing criticality and unexpected results.
